BRIEF DESCRIPTION

ZW-Smart makes it possible to program parameters in ELCOS control units that support it, offering the advantage of not having to vary the settings manually. In addition, in selected devices, it allows operations that are not possible via traditional programming, like changing the LOGO, text, etc.

This software is implemented by plugins (non-autonomous programs that interact with the main program to enhance the original functionality). Each plugin manages a type of control unit (and firmware, if necessary).

The software can be downloaded from the website www.elcos.it.

CONNECTION

The first window displayed provides access to the program's essential functioning settings.

The settings include:

- Preferred language: click on the corresponding flag to select.
- Connection: control unit connection parameters.

It can be either a serial connection (RS232, RS485, USB) or an ETHERNET connection: in this case, use the ZE-100 converter and set the IP address previously programmed in the dedicated interface software (MGate Manager).

After setting the type of connection, click on the CONNECT button.

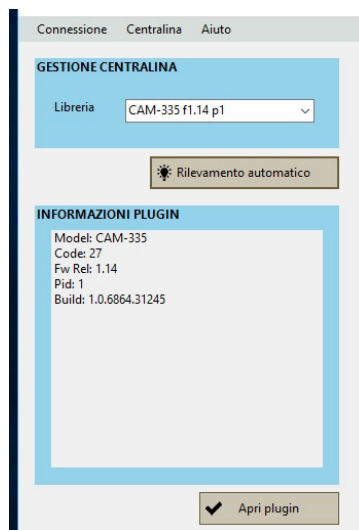

As soon as the communication is made, a window will display indicating the type of control unit and its ID information.

PLUGIN

Each control unit uses its own dedicated plugin.

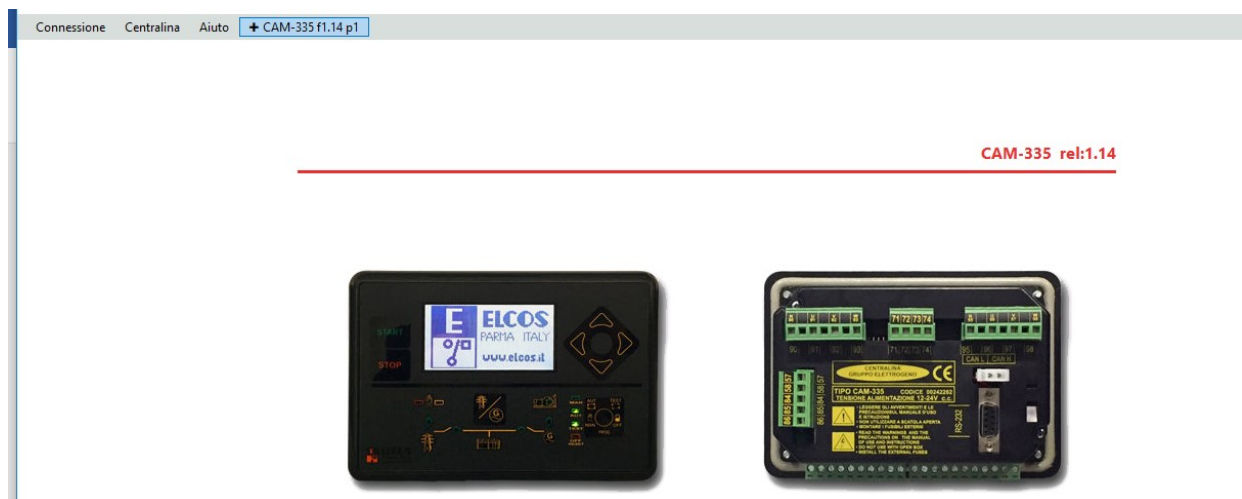

Click on the "control unit" window and then on "manage unit".

From the "library" folder, select the specific plugin for the control unit or click on auto-detect if it is already connected.

After connecting the control unit and selecting and opening the plugin, a screen with the image of the control unit will appear on the display.

To access to the PROGRAMMING MENU, select the key “+” then the model of the control unit and its release, found in the program’s main toolbar; in the case below “+ CAM-335 f1.14 p1”.

CONTROL UNIT PROGRAMMING MENU

This menu contains the functions for quick control unit programming. To help improve understanding, it was subdivided into four main Submenus and many secondary ones; the main Submenus are:

- Parameters: control unit programming (times, thresholds, switch-offs, switch-ons, etc.).
- Tuning: resets, display contrast adjustment and date/time settings.
- Logo and text: personalize logo and messages displayed on the control unit.
- Close the plugin: back to the initial menu for connection type selection.

The menus and programming folders available to each control unit vary from model to model and might not support programming accessible to other models.

PARAMETERS

The window contains all the programming, stored in folders. Each folder represents a programming section of the control unit.

To go from one folder to the next, simply click on the folder tab.

All the possible programming options are displayed for each parameter.

The following buttons are available on the toolbar:

- Used to display the default settings.
- Used to acquire the programming of the connected control unit.
- Used to transfer the programming to the connected control unit.
- “Load from file”: used to load the previously saved settings.
- “Save to file”: lets you save the settings displayed.
- Lets you print a complete list of the displayed programming.

TUNING

The window contains useful and immediate tools, such as display contrast adjustment and usage stats display, such as the control unit’s time counter, startups, and other.

In addition, the software lets you manually program the date and time or import them directly from the connected PC.

- In this window the “Update” button is used to display the control unit's current values.

LOGO and TEXT

The software lets you personalize the logo graphically and program all the text messages you want, if supported by the control unit’s hardware. It also lets you display the release.

The following buttons are available on the toolbar:

- Used to acquire the logo and text found in the connected control unit.
- Lets you transfer the displayed logo and text to the control unit.
- “Load source files”: used to display the saved logo and text messages on the display.
- “Save source files”: necessary to save the settings displayed:

- logo.bmp
- release.txt
- text.txt

“Import bin”: used to display the saved logo and text in binary form.

“Export bin”: used to save logo and text in binary form.

LOGO/TEXT PERSONALIZATION PROCEDURE

A drawing program not included with the software is required to modify the logo.

1. Read the control unit's settings.
2. Save in source code form.
3. Modify the .bmp and/or .txt file as desired (do not modify the release file).
4. Load the modified files.
5. Write in the control unit.

IMPORTANT: We recommend you save the default settings before making any changes whatsoever.

LICENSE

The software is Freeware. Read and accept the user license before installing.
